Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human VEGPD (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring betabet a carbon separation distances on opposite antiparallel strands of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        growth factor; anglogenesis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    neovascularisation; lymphangiogenesis; psoriasis; tumour; diabetes induced neovascular sequelae; rheumatoid arthritis; diabetic retinopathy; chronic inflammation; cyclic.

peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptides widneric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with anglogenesis.

Concevascularisation or lymphanglogenesis in a mammal with a condition characterised by anglogenesis, neovascularisation or lymphanglogenesis.

The condition is diabetic retinopathy, psoriasis, arthropathy, cerebrovascular accident, post-anglogiasty restenosis, head, heat or crauma, substance-induced neovascularisation of the liver, excessive trauma, substance-induced neovascularisation of the liver, excessive crauma, substance-induced neovascularisation of the liver, excessive trauma, peptides are also used to modulate vascular permeability sequelae, hypertension induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to indeed by VEGF, VEGF-C or D and are also used in combination with an anti-inflammatory agent, to treat a chronic inflammation with an anti-inflammatory agent, to treat a chick of the continuous and archititis, psoriasis and

The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human to VEGPD (vascular endothelial growth factor). The invention relates to a mesuring beta-

CC method of producing a monomeric monocyclic peptide by a mesuring beta-

CC method of producing a monomeric monocyclic peptide by a mesuring beta-

CC petides loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidiasing the cysteine residues. The monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptides with at least one amino acid deleted prior corpitation are used to interfere with anglogenesis.

CC cyclisation are used to interfere with anglogenesis.

CC cyclisation or lymphangiogenesis in a mammal with a condition characterised by anglogenesis, neovascularisation or lymphangiogenesis.

CC The condition is diabetic retinopathy, psoriasis, arthropathy, cerebrovascular accident, post-angioplasty restenosis, head, heat or cold trauma, substance-induced neovascularisation of the liver, excessive condition. The peptides are also used to modulate vascular permeability in a mammal (the mammal has a condition characterised by fluid accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are also used to inderective or brain. The peptides are also used to inderective or brain. The peptides are used to image blood vessels and lymphatic or chronic and bicyclic peptides are used to interfere with at least one biological activity induced by VEGF-C or -D and control inflammation in peripherally with an anti-inflammatory agent, to treat a chronic inflammation and plammation with an anti-inflammatic and properties and properti
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    *******
                                                                                                                                                                                                     The sequence represents a monomeric monocyclic peptide of the invention, whose 1-dimensional structure is modelled on the expose loop of human CC Whose 1-dimensional structure is modelled on the expose loop of human CC WigGPD (vascular endothellal growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring beta-cc beta carbon separation distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides, dimeric bicyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with angiogenesis, convexularisation or lymphangiogenesis.

The condition is diabeted retinopathy, psoriasis, arthropathy, hemangioma, vascularised malignant or bening tumour, post-recovery cerebrovascular accident, post-angioplasty restenosis, head, heat or cold craumer substance-induced neovascularisation of the liver, excessive hormone-related angiogenic dysfunction, diabetes induced neovascular sequelae, hypertension induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability in a mammal (the mammal has a condition characterised by fluid accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain The peptides are also used to interfere with at least one biological activity induced by VEGF, VEGF-C or D and are also used in combination with an ani-inflammatory agent, to treat a house of the liver in a menual and the inferior in the interference of the inferior in the peptides are used to interference of the account is the mammal activity induced by VEGF, VEGF-C or D and the control of the liver in the interference of the inferior in the inferior in the interference of the inferior in the inferior in the

The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human whose 3-dimensional structure is modelled on the expose loop of human configuration of your security of the invention relates to a method of producing a monomeric monocyclic peptide by a measuring beta-beta carbon separation distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and cyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior conceptides) and a cyclic peptide with at least one amino acid deleted prior conceptides) and a cyclic peptide with at least one amino acid deleted prior conceptides) and a cyclic peptide with at least one amino acid deleted prior conceptides) and a cyclic peptide with at least one lymphangiogenesis.

The condition is diabetic retinopathy, psoriasis, arthropathy, hemangioma, vascularised malignant or benign tumour, post-recovery cerebrovascular accident, post-angioplasty restenosis, head, heat or cold craume. Substance-induced neovascularisation of the liver, excessive hormone-related angiogenic dysfunction, diabetes induced neovascular sequelae, hypertension induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability in accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to image blood vessels and lymphatic or brain. The peptides are used to image blood vessels and lymphatic or brain. The peptides are used to image blood vessels and lymphatic or brain contained by longical activity induced by VEGF, VEGF-C or D and are also used in combination with an anti-inflammatory agent, to treat a chronic inflammation, with an anti-inflammatory agent, to treat a chronic inflammation with an anti-inflammatory agent, to treat a condition of the langer one broinger of the monomeric and be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The Bequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human unchanged of producing a monomeric monocyclic peptide by a measuring beta-beta carbon separation distances on opposite antiparallel strands of a peptide by a monomeric monocyclic peptide by a measuring beta-beta carbon separation distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the eysteine residues. The monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with anglogenesis, neovascularisation or lymphangiogenesis, neovascularisation or lymphangiopenesis, proteopenesis, perinopathy, hemmangioma, vascularised malignant or benign tumour, post-recovery cerebrovascular accident, post-angloplasty restenosis, head, heat or condition is diabetic retinopathy, psoriasis, head, heat or crauma, substance-induced neovascularisation of the liver, excessive hormone-related angiogenic dysfunction, diabetes induced neovascular sequelae, hypertension induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability accumulation in peripheral limbs or in lumgs, peritoned lower, to treat a countiation expected by VEEF, VEGF-C or D and are also used in combination with an anti-inflammatory agent, to treat a chronic inflammation with an anti-inflammatory agent, to treat a chronic inflammation with an anti-inflammatory agent, to treat a charmon or peripheral limbs or mention are peripherally theumatoid arthritis, psoriasis and disperipherally.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

                                       This sequence is a fragment of feline immunodeficiency virus (FIV) glycoprotein 130. Peptides AAX57038-Y57039 are used in the invention as capture polypeptides when diagnosing FIV infection. The invention relates to an antibody binding composition which consists of an enhanced capture polypeptide, which contains an immunogenic fragment of FIV gag precursor p55, and a second fragment which is part of the env precursor gp130, and an antibody-binding detection composition. The invention also includes a device for performing an assay which determines whether a felline is infected with FIV. The novel method is used for the diagnosis of Feline Immunodeficiency Virus infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Immunoglobulin binding peptide; autoimmune disease; rheumatoid arthritis; multiple sclerosis; myasthenia gravis; immunosuppressive; antirheumatic;

The invention relates to peptide sequences present in the synovial fluid and membranes of rheumatoid arthritis patients, arising from the CDR region of Oligoclonal pathogenic T-cell antigen receptor Vbeta chains. Compositions which contain autoantigenic peptides binding specifically to T-cells expressing receptors containing the peptide sequences, which include antigen-specific immunological tolerance to rheumatoid arthritis can be used for the treatment and prevention of rheumatoid arthritis. The invention can be used for the diagnosis, treatment and prevention of rheumatoid arthritis. Sequences AAY6671-958 represent peptides from the various Vbeta chains of T cell antigen receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        T-cell antigen receptor V-beta chain CDR3 region sequences accumulated in synovial membranes of rheumatoid arthritis patients.
and/or capable of inducing CTL. The tumour antigen peptide is useful for the treatment, prevention, diagnosis and vaccine production for cancers including colorectal, stomach, buccal, renal, lung, gynecological and prostate cancer. The present sequence represents a peptide recognised by HLA-A2 restricted cytotoxic T lymphocytes.
                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a tumour antigen peptide recognised by human leukocyte antigen (HLA)-A2 or HLA-A26 restricted cytotoxic T-cells (CTL)
                                                                                                                                                                                                                                                                                                        The present invention relates to immunoglobulin binding peptides. These can be used to remove autoantibodies from solutions, particularly autoantibodies associated with autoimmune diseases such as rheumatism, multiple sclerosis and myasthenia gravis, from body fluids. The present sequence is a peptide of the invention
                                                                                                                                                                                                              New immunoglobulin-binding peptides, useful for removing autoantibodies from serum, e.g. for treating rheumatism, also related solid phases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Tumor antigen peptides recognized by human leukocyte antigen (HLA)-A2 HLA-A26 restricted cytotoxic T-cells for treatment and prevention of cancer including preparation of cancer vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 HLA-A2 restricted cytotoxic T lymphocyte recognised peptide #88.

The invention relates to peptide sequences present in the synovial fluid and membranes of rheumatoid arthritis patients, arising from the CDR region of oligoclonal pathogenic T-cell antigen receptor Vbeta chains. Compositions which contain autoantigenic peptides binding specifically to T-cells expressing receptors containing the peptide sequences, which include antigen-specific immunological tolerance to rheumatoid arthritis can be used for the treatment and prevention of rheumatoid arthritis. The invention can be used for the diagnosis, treatment and prevention of rheumatoid arthritis. Sequences AAY66771-958 represent peptides from the various Vbeta chains of T cell antigen receptor
                                                                                                                                                                                                                                                                                                                                                                                                                         T-cell antigen receptor V-beta chain CDR3 region sequences accumulated in synovial membranes of rheumatoid arthritis patients.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Immunoglobulin binding peptide; autoimmune disease; rheumatoid arthritis; multiple sclerosis; myasthenia gravis; immunosuppressive; antirheumatic;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a method for diagnosing a disorder characterised by expression of a human cancer associated antigen (CAA) precursor (I) coded by a NA Group I nucleic acid molecule (NI) comprising contacting the biological sample with an agent (A) that specifically binds to NI, (I) or its fragment, complexed with an human leukocyte antigen (HLA) molecule and determining the interaction between the agent therapy and vaccine production. The method can be used in gene therapy and vaccine production. The method can be used for treating a subject with a condition characterised by expression of (I) in cells of a subject. AAB75607 and AAB75608 represent proteins from human cancer associated antigen precursors, and AAB75609 to AAB75802 represent HLA class I binding motifs in human cancer associated antigen precursors given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Diagnosing a disorder characterized by expression of a human cancer associated antigen precursor, comprises detecting interaction of an agent with a nucleic acid molecule encoding the antigen precursor.
                                                                                                                                                                                                                                               Human; cancer associated antigen precursor; cancer associated antigen; seminoma; HLA; human leukocyte antigen; cytostatic; gene therapy;

                                                                                                                                 용
                                                                                                                                                                                                   ઠે
                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes peptides that selectively home to a tissue or organ. The peptides can be used for identifying an organ or tissue, for identifying a target molecule expressed by an organ or tissue or for treating an organ or tissue pathology, where the organ or tissue is selected from prostate, lung, skin, retina, pancreas, gut, ovary, adrenal gland, liver, and lymph node. The peptide bind to the membrane dipeptidase (MDP). AAY48618 to AAY4966 represent sequences which are used in the exemplification of the present invention. (Updated on 20-MAR-
                                                                                                                              The present invention relates to immunoglobulin binding peptides. These can be used to remove autoantibodies from solutions, particularly autoantibodies associated with autoimmune diseases such as rheumatism, multiple sclerosis and myasthenia gravis, from body fluids. The present sequence is a peptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New peptides which selectively home to organs or tissues, used for, e.g. identifying target ligands and for therapy of pathological conditions.
                                                                New immunoglobulin-binding peptides, useful for removing autoantibodies from serum, e.g. for treating rheumatism, also related solid phases.

```

for immunotherapy of cancer

χ.

```
which has eyeostatic activity. The invention also describes a method for isolating (a) a polypeptide (I) that includes (S1) as part of its sequence. (b) an immunogenic protein fragment or peptide (II) derived from 9D7; (c) a pharmaceutical composition containing at least 1 of 9D7, (c) a pharmaceutical composition containing at least 1 of 9D7, (c) or (II) as active ingredients; (d) an isolated DNA (III) encoding a protein (IV) with the immunogenic properties of 9D7 or its fragments; (e) a recombinant DNA (III) that includes (III); and (E) antibodies (Ab) directed against 9D7, (I) or (II). 9D7, or its derived immunogenic competities, are used to induce a humoral and/or cellular response for use in in vivo or ex vivo immunotherapy of cancer. DNA (III) that encodes 9D7 can be used similarly and cells that express 9D7 are useful in cellular imaging, diagnosing and monitoring cancers, also, when conjugated to cyclotoxins or radionuclide, as therapeutic agents. Peptides derived from associated cancers are particularly kidney, lung, colon and breast carcinoma and Hodgkin's lymphoma. ABB108494 epiresent immunogenic carcinoma and Hodgkin's lymphoma. ABB108404 lung, colon and breast carcinoma and Hodgkin's lymphoma. ABB108404 lung, colon and breast carcinoma and Hodgkin's lymphoma. ABB108404 lung, colon and breast immunogenic
This invention describes a novel tumor-associated antigen, designated 9D7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Length 9;

The invention relates to a synthetic fibrin binding group having affinity for fibrin. The invention is useful for detecting fibrin in a mammalian subject which involves (a) detectably labelling the binding group; (b) administering to the subject the labelled polypeptide, and (c) detecting the labelled polypeptide in the subject. The invention is useful for treating a disease involving thrombus formation eg. deep-vein thrombosis, pulmonary embolism, cardiogenic thrombosis, atherosclerosis, myocardial infarct, repertusion ischaemia or stroke. The binding moieties are useful correction, imaging and localisation of fibrin-containing clots by magnetic resonance imaging, radioimaging and other imaging methods and are also useful in the diagnosis and treatment of coronary conditions where fibrin plays a role. The fibrin binding moieties are useful for are also useful in the diagnosing numerous pathophysiologies in which fibrin plays a role eg. peritoneal adhesions which often occur after surgery or inflammatory and neoplastic processes and are comprised of a fibrin cervoris, fibroblasts, macrophages and new blood vessels; rheumatoid archinis ware septic arthritis which often have bits of fibrin containing tissues called rice bodies in the synovial fluid of their containing tissues called rice bodies in the synovial fluid of their containing tissues called rice bodies in the synovial fluid of their cused to detect hypoxia or ischaemia of heart, kidney, liver, lung, brain cor ther organs, as well as the detection of tumours, diabetic cor tetinopathy, early or high-risk atherosclerosis and other autoimmune and circumopathy, early or high-risk atherosclerosis and other autoimmune and carect numbers are expected to play a role. The invention is also useful for surgoate markers of disease models in which hypoxia and andicet angiogenesis are expected to play a role. The present sequence is a fibrin

Sequence 5, Application US/09761636A

Patent No. US20020065218A1

GENERAL INCOMPATION:

APPLICANT: ACKER, Steven

APPLICANT: STACKER, Steven

APPLICANT: CENDROW, Angeld

TITLE OF INVENTION: VEGF-D/VEGF-C/VEGF PEPTIDOMIMETIC INHIBITOR

FILE REFERENCE: 1064/48505 Achen et al

CURRENT APPLICATION NUMBER: US/09/761,636A

CURRENT PILING DATE: 2000-01-18

PRIOR FILING DATE: 2000-01-18

PRIOR FILING DATE: 2000-05-16

NUMBER OF SEQ ID NOS: 34

SOFTWARE: PatentIn version 3.0

SEQ ID NO 5

LENGTH: 13

TYPE: PRI

VORGANISM: Homo sapiens

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          US-09-676-475A-63

US-09-676-475A-63

Sequence 63, Application US/09676475A

Patent No. 678453

Patent No. 678453

APPLICANT: Ruoslahti, Erkki

APPLICANT: Rajotte, Daniel

TITLE OF INVENTION: Membrane Dipeptidase

TITLE OF INVENTION: Membrane Dipeptidase

FILE REFERENCE: P-LA 43770.

CURRENT FILING DATE: 1998-03-13

PRIOR APPLICATION NUMBER: 09/042,107

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

"Identification of a peptide inhibitor of galactose oxidase from
"Identification of a peptide inhibitor of galactose oxidase.";
Fed. Proc. 31:447-447(1972).
-!- FUNCTION: Binds one copper ion per molecule but does not bind the
galactose oxidase apoenzyme. It may inactivate the enzyme by
binding to its prosthetic copper group.
PIR; A01341; XEYDGD.

Indentification and characterization of the products from the traJ and traY genes of plasmid R100.";
J. Bacteriol. 170:2749-2757(1988).
J. Bacteriol. 170:2749-2757(1988).
PUNCTION: Transfer gene protein. Is involved in the conjugation process of bacterial cells for the exchange of plasmid DNA.
SUBCELLULAR LOCATION: Cytoplasmic.
SUBCELLULAR Belongs to the traM family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Rattus norvegicus (Rat).

Submitted (MAR-2004) to Swiss-Prot.
--- FUNCTION: May play a role in clustering and fusion of late endosomes and lysosomes (By similarity).
--- SUBUNIT: Homooligomer (By similarity).
--- SUBCELLULAR LOCATION: Cytoplasmic and associated with the membranes of lysosomes and late endosomes (By similarity).

peptide topp tragment from an exposed topp of a glowin factor protein and cyclising the peptide by oxidising the cycleine residues. The monocyclic peptides with at least one amino acid deleted prior to cyclisation are used to interfere with angiogenesis.

To cyclisation are used to interfere with angiogenesis, a condition to envisor to cyclisation or lymphangiogenesis in a mammal with a condition characterised by angiogenesis, neovascularisation or lymphangiogenesis.

The condition is diabetic retinopathy, psoriasis, arthropathy, hemangioma, vascularised malignant or benign tumour, post-recovery cerebrovascular accident, post-angioplasty restenosis, head, heat or cold trauma, substance-induced neovascularisation of the liver, excessive hormone-related angiogenic dysfunction, diabetes induced neovascular sequelae, hypertension induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability in a mammal (the mammal has a condition characterised by fluid accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to image blood vessels and lymphatic or brain. The peptides are used to image blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere with at least one biological activity induced by VEGF, VEGF-C or -D and are also used in combination with an anti-inflammatory agent, to treat a chronic inflammation, especially rheumatoid arthritis, psoriasis and

The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human CV Whose 3-dimensional structure is modelled on the expose loop of human configuration of producing a monomeric monocyclic peptide by a measuring beta-beta carbon separation distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior cyclisation are used to interfere with anglogenesis.

CC cyclisation are used to interfere with anglogenesis.

CC covilation are used to interfere with anglogenesis.

CC covilation is diabetic retinopathy, postiast, arthropathy, chemangioma, vascularised malignant or benign tumour, post-recovery cerebrovascular accident, post-angioplasty restenosis, head, heat or cold trauma, substance-induced neovascularisation of the liver, excessive contenum, substance-induced neovascularisation of the liver, excessive contenum, substance-induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability cor brain. The peptides are used to image blood vessels and lymphatic accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, carcumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, current and bicyclic peptides are used to image blood vessels and lymphatic control inflammatory agent, to treat a contribute inflammation with an anti-inflammatory agent, to treat a contribute of the control of contr
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

characterised by angiogenesis with adjuggenesis, or characterised by angiogenesis, neovascularisation or lymphangiogenesis in a mammal with a condition characterised by angiogenesis, neovascularisation or lymphangiogenesis. The condition is diabetic retinopathy, psoriasis, arthropathy, certain a vascularised malignant or benign tumour, post-recovery cerebrovascular accident, post-angioplasty restenosis, head, heat or cold trauma, substance-induced neovascularisation of the liver, excessive trauma, substance-induced neovascular sequelae, hypertension induced neovascular sequelae, bypertension induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability or brain. The peptides are used to inage blood vessels and lymphatic or brain. The peptides are used to inage blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere with at least one biological activity induced by VEGF. Or -D and are also used in combination with an anti-inflammatory agent, to treat a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ;

                                                                                                                                                                                                                                                                                 The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human VEGFD (vascular endothelial growth factor). The invention relates to a method of producing a monomeric mocyclic peptide by a measuring beta-beta carbon separation distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior to cyclistation are used to interfere with angiogenesis,
                                                                                                                            Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

The Begginance represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human vEGFD (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring betace beta carbon separation distances on opposite antiparallel strands of a cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior peptides) and a cyclic peptide with at least one amino acid deleted prior copylisation are used to interfere with anglogenesis.

CC cyclisation are used to interfere with anglogenesis, covery cocylisation or lymphangiogenesis, neovascularisation or lymphangiogenesis, neovascularisation or lymphangiogenesis, neovascularisation or lymphangiogenesis.

CC cyclisation is diabetic retinopathy, psoriasis, arthropathy, correbrovascular accident, post-angloplasty restenosis, head, heat or charma, substance-induced neovascularisation of the liver, excessive corpusions, and appeared neovascularisation of the liver, excessive corpusions. The peptides are also used to modulate vascular permeability corpusation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are also used to inage blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere with at least one biological activity induced by VEGF, Corporation or province inflammatory agent, to treat a corpusation in paripheral limbs or inlungs, peritoneal cavity, pleura, or chronic inflammation with an anti-inflammatory agent, to treat a corpusation in paripherally rheumatoid arthritis, psoriasis and corpusation are also used to compare and province of corpusation in paripherally rheumatoid arthritis, psoriasis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                       Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The sequence represents a monomeric monocyclic peptide of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human vegos 1 vacular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring beta carbon separation distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with angiogenesis, neovascularisation or lymphanglogenesis in a mammal with a condition characterised by angiogenesis, neovascularisation or lymphanglogenesis. The condition is diabetic retinopathy, psoriasis, arthropathy, hemangloma, vascularised malignant or benign tumour, post-recovery crebrovascular accident, post-angioplasty restenosis, head, heat or cold trauma, substance-induced meovascularisation of the liver, excessive hormone-related angiogenic dysfunction, diabetes induced neovascular sequelae, hypertension induced neovascular sequelae, or chronic liver.

The peptides are also used to modulate vascular permeability in a mammal (the mammal has a condition characterised by fluid accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to image blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere with at least one biological activity induced by VEGF. VEGF-C or D and are also used in combination with an anti-inflammatory agent, to treat a chronic inflammation, especially rheumatoid arthritis, psoriasis and

                                                                                                                           The peptide is conformationally constrained by groups attached to each side. The peptide mimics a beta turn and can bind to at least one HIV envelope protein, thus inhibiting infection. It inhibite the interaction between HIV envelope glycoproteins and human cell-surface protein CD4 by mimicking structures of CD4. See also AAR24950-R24959 and AAR25122. (Updated on 25-MAR-2003 to correct PN field.)
